ATEK PLASTICS ADDS PORTABLE CLEAN ROOMS

ATEK Plastics, an ISO 13485 and 9001 certified manufacturer, adds portable clean rooms to their list of facility capabilities.

The company recently constructed multiple portable 100,000 class clean rooms around their existing presses at the Kerrville facility due to new medical growth. The clean room units will be used to make surgical components and stem cell therapy devices. More clean room units and additional presses are to be added in 2011.

Molding presses at their facility are also equipped with individual eDART System monitors and full servo robotics supported by product specific vision systems, box loaders, and automated work cells. With real-time production monitoring through IQMS, ATEK's Master Molder certified technicians are able to develop repeatable processes that are based on collected data.

ATEK Plastics started manufacturing medical device components in 2001 and today medical products manufactured at their facility amount to 89% of their business. Molded components manufactured at the facility are predominately for cardiac surgery, stem cell therapy and pre-surgical skin preparation.
